I may not have a bachelor’s degree or a resume that shows I have experience, but when it comes to computers, I can do a decent amount. I won’t say I know everything because that would be a lie, because it would be impossible to know it all. I have removed passwords for locked out windows computers, even removed a password from an iTunes device. I have removed countless viruses some that lock up your computer and stop all virus protection. I have changed hardware in computers and even built them. I have set up networks. I have even written a couple up book about basic computer maintenance, while in college I was the go-to person by the students for all their computer needs. I have used forensic recovery software to recover deleted pictures on phones and computers. I learned all of this on my own needless to say each and everything I taught myself was because I needed it at one point in time. The forensic recovery was due to a loss of pictures for my aunt. The pictures were accidently deleted at a Walgreens causing her to be in tears because they were of her grandchild when she was born, she came to me as a last hope. I told her that I would try my best as I have never attempted that before but after countless hours of research trial and error, I was able to recover everything that was deleted put them all on a cd for her and surprised her the next day. I have not found an issue that I couldn’t fix yet. When something seemed impossible, I never gave up I would do lots of research and take breaks to think about what I could possibly be missing. I did do my work study in the IT Department of Allen University, that was fun I always was asking questions and helping out, it even got to the point they would be calling me to ask me questions about some things. I am currently learning cyber security possibly going to finish my degree at WGU am certified security plus and also google cybersecurity certificate. I decided to just finish my degree because no one seems to believe that anyone without a degree could possibly know enough to work for them.
